Appendix D: Balance between People's Committee Chairmen Terms

Covariate	<u>First Term</u>		<u>Second Term</u>		<u>Difference</u>	
	Mean	SD	Mean	SD	T-Statistic	P-Value
Age	53.82	3.36	55.07	2.79	1.58	0.12
Years of Education	2.32	1.04	2.83	1.28	1.60	0.11
Serving in Birth Province	0.65	0.49	0.76	0.43	0.88	0.38
Must Retire (Age>54)	0.61	0.50	0.71	0.46	0.80	0.43

Each row represents the results of a t-test with null hypothesis that there is no difference between new and old PCOMS on the covariate.

Appendix E: Replication of Figure 4 with Interflex

Using STATA's inteflex package (see Xu, Y., Hainmueller, J., Mummolo, J. and Liu, L., 2017. INTERFLEX: Stata module to estimate multiplicative interaction models with diagnostics and visualization.)

Appendix F: Correlation between Bribes over Revenue and UCT Measure of Corruption in PCI Surveys.

The figure below demonstrates the spatial correlation between our direct measure of bribes size and a shielded response measure of bribe propensity using the Unmatched Count Technique (UCT) (sometimes called a “list experiment”) that was added to the PCI data set in 2010-2016. The two measures are strongly correlated at the provincial level ($R^2=.61$). Provinces seen as highly corrupt on one measure are also seen as corrupt on the other. This indicates that social desirability bias is not driving our findings. See Malesky, Georguiev, and Jensen (2015) for a description of the method and specific application to Vietnam.¹ We use the following UCT question as a benchmark.

UCT Question: Please take a look at the following list of common activities that firms engage in to expedite the steps needed to receive their investment license/registration certificate. How many of the activities did you engage in when fulfilling any of the business registration activities listed previously?

1. Followed procedures for business license on website.
2. Hired a local consulting/law firm to obtain the license the firm for you.
3. *Paid informal charge to expedite procedures (Only Available on Form B of the Survey)*²
4. Looked for a domestic partner who was already registered

¹ Malesky, E.J., Gueorguiev, D.D. and Jensen, N.M., 2015. Monopoly money: Foreign investment and bribery in Vietnam, a survey experiment. *American Journal of Political Science*, 59(2), pp.419-439.

² Note informal charges (*chi phi khong chinh thuc*) is the common Vietnamese and English term to describe this type of bribery.

coef = .41967303, se = .04213913, t = 9.96

coef = .03004923, se = .00610048, t = 4.93

Highlights

- We synthesize rent-seeking and norm-based explanations of firm bribery, showing their applicability depends on market competition.
- In open markets with easy business entry, the social norm theory is most relevant, which explains non-collusive (coercive) forms of bribery.
- In restricted markets (due to formal or informal entry barriers), rent-seeking explanations are applicable, explaining collusive bribes.
- Uncertainty increases the benefits of rent-seeking in restricted environments, increasing firm participation in collusive bribery.
- These hypotheses are tested on 11 years (2006 to 2017) of high-quality annual survey data of 10,000 businesses in 63 Vietnamese provinces.
